

The system of action for the operating room.

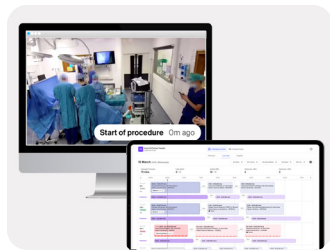

Proximie's **Intelligence Suite** enables hospitals to actively manage operating room (OR) performance in real time.

Using ambient computer vision and AI, it automatically captures key perioperative events and generates a live operational timeline of the operating day. Integrated with your EHR, it creates a unified view of performance across rooms, teams, and lists.

Built-in predictive models continuously forecast case finish times, flag likely overruns, and identify workflow risks early. Automated prompts and notifications enable teams to intervene before delays cascade and schedules are disrupted.

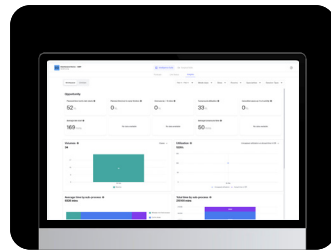

The result is greater predictability, improved throughput, and measurable OR optimization within existing resources.

How it works

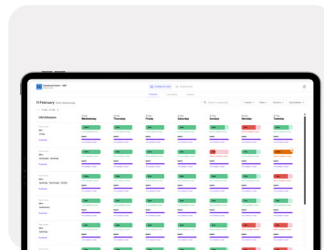

Ambient, real-time OR data capture

Computer vision detects key surgical events automatically, eliminating manual data entry while ensuring de-identified, compliant data capture.

Unified, EHR-integrated operational view

EHR integration creates a continuous data loop, delivering live visibility across the perioperative pathway and reducing administrative burden.

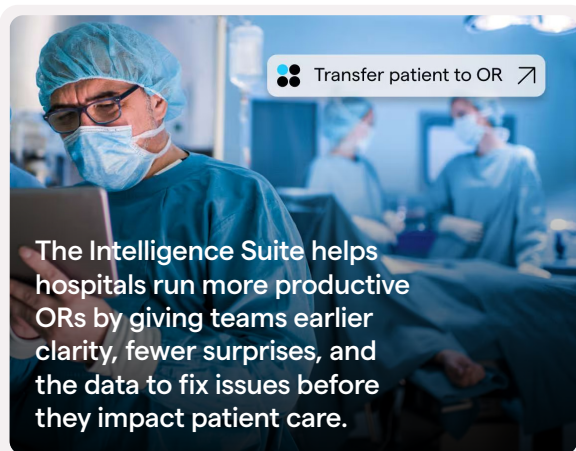

AI-powered forecasting and action

Predictive models forecast finish times and identify likely overruns.

Keep teams informed in real time

Dashboards, prompts, and notifications integrate into existing workflows to keep teams aligned, improve turnover timing, and increase daily list predictability.

The Intelligence Suite helps hospitals run more productive ORs by giving teams earlier clarity, fewer surprises, and the data to fix issues before they impact patient care.

overtime saving

“

Our evaluation shows that when surgical teams have access to accurate, data-driven insights, it can translate directly into measurable efficiency gains.

By identifying small but meaningful workflow improvements, we were able to save almost an hour across each surgical list – enough time to complete an additional case without extending theatre hours.”
